

Private DNS

Azure Private DNS Zone is a service provided by Microsoft Azure that allows you to create a private domain in Azure's DNS system. This domain can be used to provide name resolution for resources within a virtual network (VNet) or between peered VNets.

Key Features and Benefits:

1. **Private DNS Name Resolution:** Allows you to resolve the names of resources in your virtual network without the need for public internet DNS.
2. **Integration with Azure Resources:** Seamlessly integrates with Azure Virtual Networks (VNets), Virtual Machine Scale Sets, and other Azure resources.
3. **Custom DNS Names:** You can define custom domain names (e.g., contoso.local) and map them to Azure resources.
4. **Centralized DNS Management:** Provides a central location to manage DNS settings for Azure resources, reducing the overhead of managing multiple DNS configurations.
5. **DNS Traffic Routing:** Helps in routing DNS queries between virtual networks when they are peered together, ensuring consistent name resolution across interconnected VNets.
6. **Security and Isolation:** Keeps DNS traffic within the Azure backbone network, enhancing security by avoiding exposure to the public internet.

Use Cases:

1. **Private Domains for Azure Resources:** Use private DNS zones to define custom domain names for Azure VMs, Azure SQL Databases, Azure Storage accounts, etc., within a VNet.
2. **Centralized DNS Management:** Simplify DNS management by consolidating DNS configurations for various Azure resources under a single private DNS zone.
3. **Cross-VNet Name Resolution:** Facilitate name resolution across peered VNets without exposing internal resource names to the public internet.

The end goal is to have a network setup where the demo server and test server can access the web server's IIS page via the internal domain name, with seamless DNS resolution enabled through a private DNS zone and network peering. This ensures secure and efficient internal communication between the VMs without exposing them to the public internet.

To begin with the Lab:

1. In this lab we have launched 2 VM. One has the Public IP address in which we are going to log in. The second VM does not have any public IP address, it only has a Private IP address but has IIS installed on it. So, you have to prepare all this before you begin. Also, you can use the Setup file to install IIS directly on your second VM or you can create it normally with a public IP address, login to the machine install

IIS create a default HTML page, and then come back and delete the public IP address of your second VM. You can use any approach.

- Below you can see that our one VM is called a demo server with a public IP address, but no IIS installed.

The screenshot shows the Azure portal interface for a virtual machine named 'demo-server'. The left sidebar contains navigation links for Overview, Activity log, Access control (IAM), Tags, Diagnose and solve problems, Connect (with options for Connect and Bastion), Windows Admin Center, Networking (Network settings, Load balancing, Application security groups, Network manager), Settings (Disks), and Container (Container settings). The main content area is titled 'demo-server' and shows the 'Virtual machine' tab under 'Essentials'. Key details include:

Setting	Value
Resource group (move)	: demo-resource-group
Status	: Running
Location	: North Europe
Subscription (move)	: Azure Pass - Sponsorship
Subscription ID	: 6e13e5d6-4287-42a8-b80f-91d6b14e3aec
Operating system	: Windows (Windows Server 2022 Datacenter)
Size	: Standard D2s v3 (2 vcpus, 8 GiB memory)
Public IP address	: 13.79.134.77
Virtual network/subnet	: demo-server-vnet/SubnetA
DNS name	: Not configured
Health state	: -
Time created	: 28/5/2024, 7:43 am UTC

Below the essentials section, there are tabs for Properties, Monitoring, Capabilities (8), Recommendations, and Tutorials. The Properties tab is selected, showing the 'Virtual machine' and 'Networking' sections. The 'Virtual machine' section lists the computer name as 'demo-server', operating system as 'Windows (Windows Server 2022 Datacenter)', VM generation as 'V2', VM architecture as 'x64', agent status as 'Ready', and agent version as '2.7.41491.1121'. The 'Networking' section shows the public IP address as 13.79.134.77, private IP address as 10.0.0.4, and DNS name as 'Configure'.

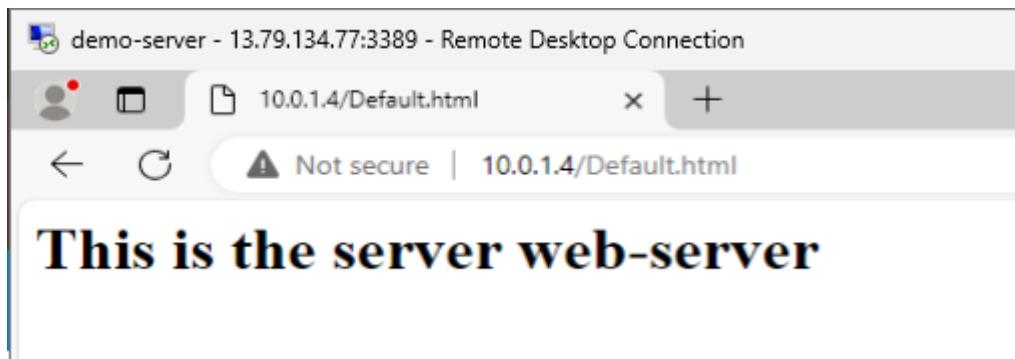

- Here is your second VM web server. It does not have any public IP address, but IIS is installed on this machine.

The screenshot shows the Azure portal interface for a virtual machine named 'web-server'. The left sidebar contains the same navigation links as the previous screenshot. The main content area is titled 'web-server' and shows the 'Virtual machine' tab under 'Essentials'. Key details include:

Setting	Value
Resource group (move)	: demo-resource-group
Status	: Running
Location	: North Europe
Subscription (move)	: Azure Pass - Sponsorship
Subscription ID	: 6e13e5d6-4287-42a8-b80f-91d6b14e3aec
Operating system	: Windows (Windows Server 2022 Datacenter)
Size	: Standard D2s v3 (2 vcpus, 8 GiB memory)
Public IP address	: -
Virtual network/subnet	: demo-server-vnet/SubnetB
DNS name	: -
Health state	: -
Time created	: 28/5/2024, 7:47 am UTC

Below the essentials section, there are tabs for Properties, Monitoring, Capabilities (8), Recommendations, and Tutorials. The Properties tab is selected, showing the 'Virtual machine' and 'Networking' sections. The 'Virtual machine' section lists the computer name as 'web-server', operating system as 'Windows (Windows Server 2022 Datacenter)', VM generation as 'V2', VM architecture as 'x64', agent status as 'Ready', and agent version as '2.7.41491.1121'. The 'Networking' section shows the public IP address as '-' (no public IP), private IP address as 10.0.1.4, and DNS name as '-'.

- Now you need to log in to the demo server VM. Once you are in, if you open the Edge browser and paste the Private IP address of your web server VM then you can see the web page accordingly.

5. Now search the marketplace for a private DNS zone and choose the service accordingly.

Plan

Private DNS zone [Create](#)

6. Then you need to choose your resource group and give the name of your domain. Also, you don't need to buy any domain name, it is a private DNS zone, and this will be private for our virtual network.

Basics Tags Review create

A Private DNS zone provides name resolution services within virtual networks. A Private DNS zone is accessible only from the virtual networks that it is linked to and can't be accessed over internet. For example you can create a Private DNS zone named contoso.com and then create DNS records like www.contoso.com in this zone. You can then link the zone to a one or more virtual networks. Project details

Select the subscription to manage deployed resources and costs. Use resource groups like folders to organize and manage all your resources.

Subscription *	Azure Pass - Sponsorship
Resource group *	demo-resource-group
	Create new

Instance details

Name *	cloudservices.com
Resource group location	North Europe

- Once it is deployed open it and go to virtual network links and then link your network. For that click on add.

The screenshot shows the 'Virtual network links' blade for the 'cloudservices.com' Private DNS zone. The left sidebar has 'Virtual network links' selected under 'Settings'. The main area has a search bar, an 'Add' button, and a table with columns: Link Name, Link status, Virtual network, and Auto-Registration. The table displays the message 'No results.'

- Now you need to give it a name, choose your virtual network, enable auto registration then click on add.

Add virtual network link ...

cloudservices.com

Link name *

demo-network-link

Virtual network details

i Only virtual networks with Resource Manager deployment model are supported for linking with Private DNS zones.
Virtual networks with Classic deployment model are not supported.

I know the resource ID of virtual network ⓘ

Subscription * ⓘ

Azure Pass - Sponsorship

Virtual network *

demo-server-vnet (demo-resource-group)

Configuration

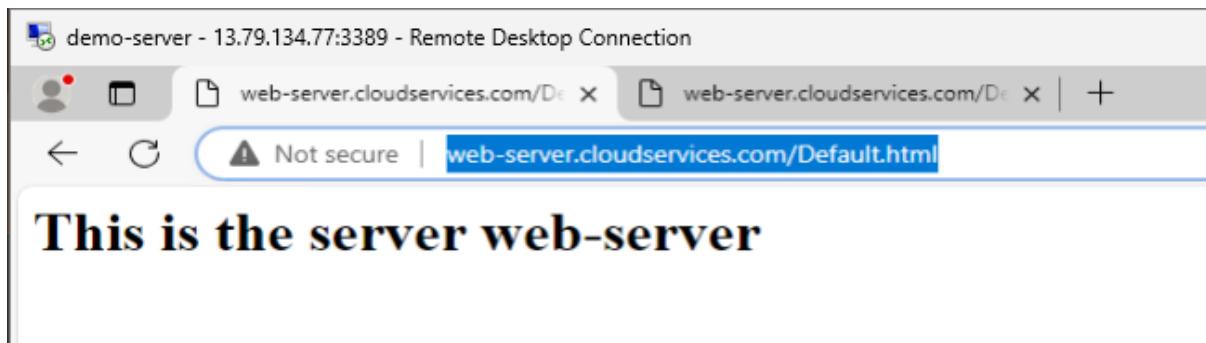

Enable auto registration ⓘ

9. Now in your private DNS zone if you go to overview you will see that you have records for the demo server and web server.

Name	Type	TTL	Value	Auto registered
@	SOA	3600	Email: azureprivatedns-host.microsoft.com Host: azureprivatedns.net Refresh: 3600 Retry: 300 Expire: 2419200 Minimum TTL: 10 Serial number: 1	False
demo-server	A	10	10.0.0.4	True
web-server	A	10	10.0.1.4	True

10. Now in your VM if you go and use your domain name to access the web page then you can do that and get the results.

web-server.cloudservices.com/Default.html

11. Now if you want to have just the domain name to access your web page then go to the overview of private DNS zone and click on add record set.

A screenshot of the Azure portal showing the "cloudservices.com" Private DNS zone overview. On the left, there's a sidebar with options like Overview, Activity log, Access control (IAM), Tags, and Diagnose and solve problems. The main area has a search bar and a toolbar with "Record set" (highlighted with a red box), Move, Delete zone, and Refresh buttons. Below that is the "Essentials" section with details: Resource group (move) : demo-resource-group, Subscription (move) : Azure Pass - Sponsorship, Subscription ID : 6e13e5d6-4287-42a8-b80f-91d6b14e3aec, and Tags (edit) : Add tags.

12. While adding the resource set you don't need to give a name just give the private IP of the web server VM.

Add record set

X

cloudservices.com

Name

.cloudservices.com

Type

A – Address record

TTL *

1

TTL unit

Hours

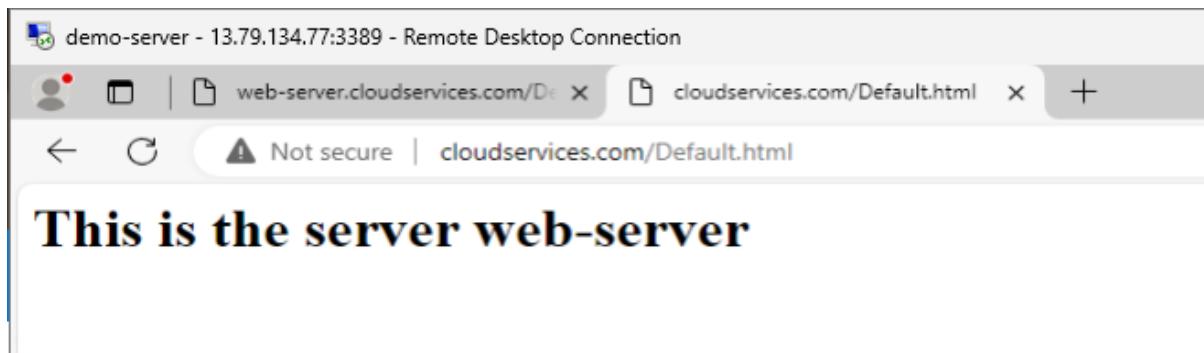

IP address

10.0.1.4

...

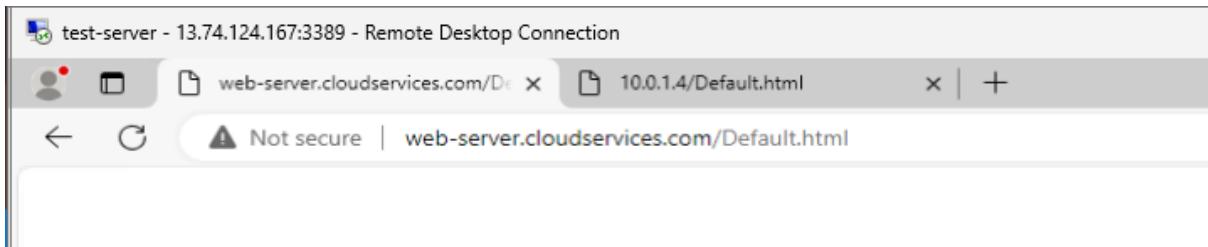

0.0.0.0

13. Below you can see that you have the results as expected.

😊 Peered Networks

1. Now we are going to launch another VM **test server** and this VM will have a **new Virtual Network** with a **Public IP address**. Once it is launched then you need to establish a peering connection between the **test server VM** and the **demo server VM**.
2. Once it is all done then log in to the test server VM. In your VM open Edge browser and run this link you will see that the page is going blank.

3. But if use the Private IP address of your web server VM then you will get the result as expected.

4. So, now come to the private DNS zone, go to virtual network links, and click on add to create another.

A screenshot of the Azure portal showing the "Virtual network links" blade for a private DNS zone. The left sidebar includes "Overview", "Activity log", "Access control (IAM)", "Tags", "Diagnose and solve problems", "Settings", "Virtual network links" (which is selected), and "Properties". The main content area shows a table of existing virtual network links:

Link Name	Link status	Virtual network	Auto-Registration	...
demo-network-link	Completed	demo-server-vnet	Enabled	...

5. Now give it a name then choose your virtual network as Test server VN. Then enable auto registration.

Add virtual network link ...

cloudservices.com

Link name *
